· MOLECULAR BIOLOGY: SARS-CoV-2 (COVID 19) Detection (Qualitative) by Real Time rt PCR

• TEST : Qualitative RNA detection of SARS-CoV 2 (COVID19)

METHOD : Real time reverse transcription PCRSPECIMEN : Nasopharyngeal & Oropharyngeal Swab

· RESULT:

SARS-CoV-2 (COVID 19)

Negative

## Interpretation:

**Positive:** Indicates the presence of SARS-CoV-2 (COVID 19)in the given specimen **Negative:** Indicates the absence of SARS-CoV-2 (COVID 19)in the given specimen

## **Test Limitations:**

- A positive result does not distinguish between a viable/ replicating organism and a non-viable organism.
- False Negative results may be seen in samples collected too early or too late in the clinical course of the illness. Kindly refer to the latest ICMR guidelines.
- Presence of PCR inhibitors in the sample may prevent DNA amplification. Paradoxical results may arise due selection of inappropriate specimens and contamination during specimen collection.
- Sensitivity of this test depends upon the quality of the sample submitted for testing and stage of the infection

## Comments:

Kindly consult referring Physician/ Authorized Govt. hospital for appropriate follow up.

Details of all the positive patients will be communicated to Epidemiology Cell – Greater Chennai corporation. Please ensure to notify the local / state/ federal authorities as per the existing rules/regulations.

NOTE: Covid -19 Test done by ICMR /FDA /CE-IVD Approved Kits ONLY.
